

Forcepoint ARIA

Adaptive Risk Intelligence Assistant

Challenge:

- › Data security can require specialized product and policy expertise
- › Complex security workflows add time and operational effort
- › Growing user and security activity makes it harder to know where to focus

Solutions:

- › Conversational AI built directly into the experience
- › Product expertise combined with supported context from your environment
- › Natural-language access to insights, recommendations and supported actions

Value:

- › Make effective data security easier to operate
- › Reduce operational complexity and dependency on deep product expertise
- › Help teams focus on what matters and move from question to action

Put AI to Work for Data Security

Make data security easier to operate with AI built into the Forcepoint experience.

Data Security at the Speed of AI

AI is accelerating how business gets done while data security continues to grow more complex. Security teams need to protect sensitive information, manage policies, investigate incidents, understand user risk and determine what needs attention, often across complex security workflows.

Doing that effectively can require specialized expertise: knowing which policies are relevant, how to interpret an incident, where risk is concentrated and how to navigate the right product workflows.

Forcepoint ARIA brings AI directly into the data security experience, putting Forcepoint expertise and security context at teams' fingertips.

Using natural language, ARIA combines Forcepoint product expertise with supported context from your environment to help teams understand what's happening, find relevant information and recommendations and move into supported actions.

Teams can find and deploy predefined DLP policies, investigate incidents, understand user risk and activity and perform supported administrative tasks without needing to know every policy, workflow or configuration path.

The result is data security that's easier to operate, more efficient to manage and faster to act on.

Put Forcepoint Expertise to Work

ARIA is designed around the data security work teams perform every day.

Rather than requiring users to know where every capability lives or how every workflow works, ARIA lets them start with what they need to accomplish using natural language. It brings together Forcepoint expertise and context from their environment to help turn intent into relevant information, recommendations and supported actions.

This makes data security capabilities more accessible across the security team while helping experienced practitioners work more efficiently.

The Right Protection in Place

Effective data protection starts with having the right policies in place. But translating business, regulatory and security requirements into the right controls can require specialized expertise.

ARIA makes that process easier by helping teams identify relevant predefined Forcepoint policies based on their industry, region or business needs and move those policies toward deployment.

The result is a simpler path from business requirements to effective protection, with less dependency on deep product and policy expertise.

Investigate with Context

When a potential data loss incident occurs, analysts need to understand what happened, why it matters and what deserves attention.

ARIA brings relevant incident context and evidence into a conversational experience, helping analysts make sense of an event without requiring them to manually piece together information across complex workflows.

Analysts get the context they need to make more informed decisions and move from alert to investigation and response with less effort.

Know Where to Focus

As security activity grows, the challenge isn't simply seeing more. It's knowing what matters.

ARIA helps teams understand where user risk is concentrated and provides context around the activity driving that risk, making it easier to identify patterns, prioritize users and events and focus investigations where they can have the greatest impact.

Security teams can spend less time sorting through activity and more time focused on risks that matter most.

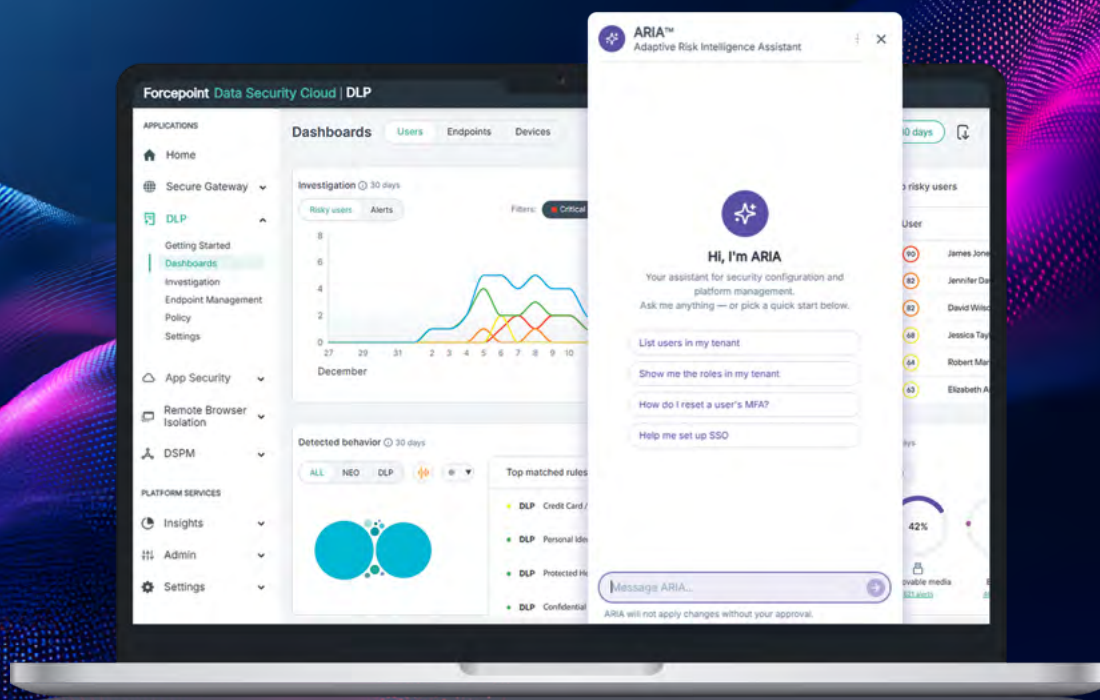

Simplify Security Administration

Data security teams also spend valuable time managing the users, access, authentication and administrative workflows that keep their environment running.

ARIA brings natural-language interaction to supported administrative tasks, making common workflows easier to navigate without requiring users to know every setting or configuration path.

This reduces administrative complexity and makes the Forcepoint data security environment easier to operate.

AI Built for Data Security Work

ARIA goes beyond a conversational interface by bringing together the expertise, context and supported actions security teams need to get work done.

Forcepoint Expertise at Your Fingertips

Access Forcepoint product and policy expertise through natural language, helping users work effectively without needing deep knowledge of every policy, capability or configuration path.

Context from Your Environment

Bring supported context from your Forcepoint environment into the conversation to better understand policies, incidents, users and security activity.

From Insight to Action

Move beyond finding information to recommendations and supported actions, reducing the steps between understanding what needs to be done and getting it done.

AI-Assisted. Human-Controlled.

Keep people in control as AI helps move work forward. Supported actions are proposed while administrators retain approval over security changes.

Make Data Security Easier to Operate

With ARIA, Forcepoint brings AI directly into the data security experience to help teams:

The Right Protection in Place

Turn business and security requirements into relevant protection with less complexity.

Investigate with Context

Understand what happened and get the context needed to make informed decisions.

Know Where to Focus

Turn user risk and security activity into clearer priorities.

Simplify Security Administration

Make everyday security operations easier to manage.

**Forcepoint expertise. Context from your environment.
AI that helps turn intent into action.**

Experience Forcepoint ARIA

Put AI-assisted data security to work in your environment.

Experience ARIA in Forcepoint Data Security Cloud and see how natural language simplifies DLP policy setup, accelerates investigations, and makes data security easier to manage.
