

Migrating to Forcepoint ONE for Web Security

Forcepoint ONE gives you modern, Zero Trust security for controlling access, activities, and the use of data in web, cloud, and private applications. Built on a true SASE/SSE cloud platform, its secure web gateway (SWG) has strong, easy-to-use data loss prevention (DLP), CASB cloud security capabilities, and even Zero Trust Network Access (ZTNA).

Forcepoint ONE enables business policies to be managed centrally and enforced on the endpoint or in cloud. This delivers the best mix of speed, security, and ease of administration—at home, in the office, or anywhere in between.

Moving to Forcepoint ONE can help you address pressing business initiatives such as:

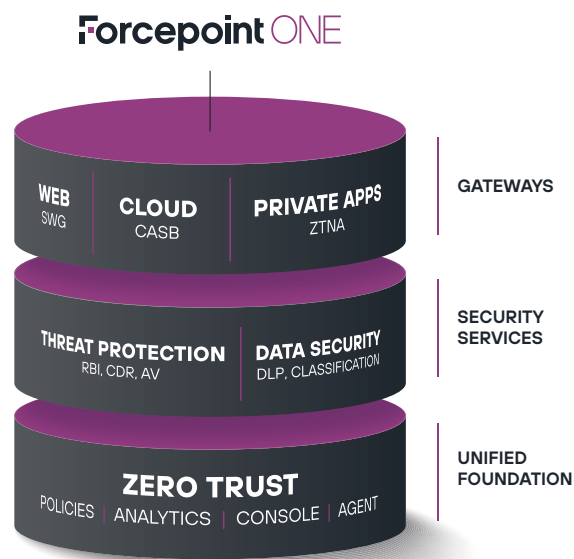

- › Turning your remote workforce to a hybrid workforce, efficiently and safely
- › Securing guest access to the web from your offices according to your own policies
- › Identifying and controlling unsanctioned “shadow IT” apps that could put your data at risk
- › Transitioning your infrastructure to a modern, Zero Trust-based SASE architecture

Simplifying your move to Forcepoint ONE

Together with our global network of solution partners, we’re here to make the migration from your existing web security solution to Forcepoint ONE a quick success. With our innovative Zero Trust Web Access approach to security, you can confidently modernize and simplify your security operations while making your remote and hybrid workforce safer and more productive.

Which Forcepoint ONE edition is right for you?

Forcepoint ONE offers a range of security services. You can start with just the capabilities you need now (such as web security) and expand later to our all-in-one platform. Either way, you get unified threat protection and data security from ONE console, with ONE set of policies to manage, from ONE vendor you can trust.
