

3 Security Concerns to Address in Office 365

Whether you've already implemented Office 365 or are considering adopting it, you need to ensure your business data remains secure.

Office 365 is used by more than 40,000 businesses in Australia, which makes it even more critical to address the following concerns. [Source](#)

1

Threat Protection

Though Office 365 includes native security features, they are not as comprehensive as those offered by third-party services.

2

Byod

Uncontrolled access to Office 365 from unmanaged devices creates additional security gaps.

Better Protected

Most organisations that have added third-party security to Office 365 say that they are better protected than with just the service's native security.

3

2nd Tier Apps

Many users connect additional apps to Office 365, but these are not protected by the service's native security.

4

Forcepoint

Forcepoint provides comprehensive protection for Office 365 and other apps, so you can make the most of your investment without putting your business data at risk.

Comprehensive Protection

- Machine learning and behaviour analysis uncovers suspicious activity
- Set different policies for managed and unmanaged devices
- Secure and control all apps—including 2nd tier services—from one place
