

3 Security Issues With Office 365

Is your organisation already on Office 365 or thinking about using it? Then you need to know the three ways it can put your data at risk.

Office 365 has more than 180 million users across the world, which makes it even more critical to address the following concerns.

1

Threat Protection

Many IT security experts say that Office 365's security features do not offer the same level of protection as third-party security services.

2

Unmanaged Devices

When employees access Office 365 services from their own devices without additional controls, it can put your information at greater risk.

3

Additional Apps

Users can connect popular productivity apps to Office 365 services, but each of these additional apps needs their data own security.

Secure Data

Most organisations that have added third-party security to Office 365 say that their business data is more secure.

4

Forcepoint

Forcepoint provides complete protection for Office 365 and your organisation's other productivity apps, so your teams can work effectively without putting your business data at risk.

Comprehensive Protection

- Identify suspicious activity automatically using machine learning and behaviour analysis
- Set different policies for managed and unmanaged devices
- Secure and control all Office 365 and additional apps from one place
